

From one patch effect to testable causal explanations

Li, Saphra et al. released Dyck models · 512 new cyclic families · forecasts fixed before hybrid interventions

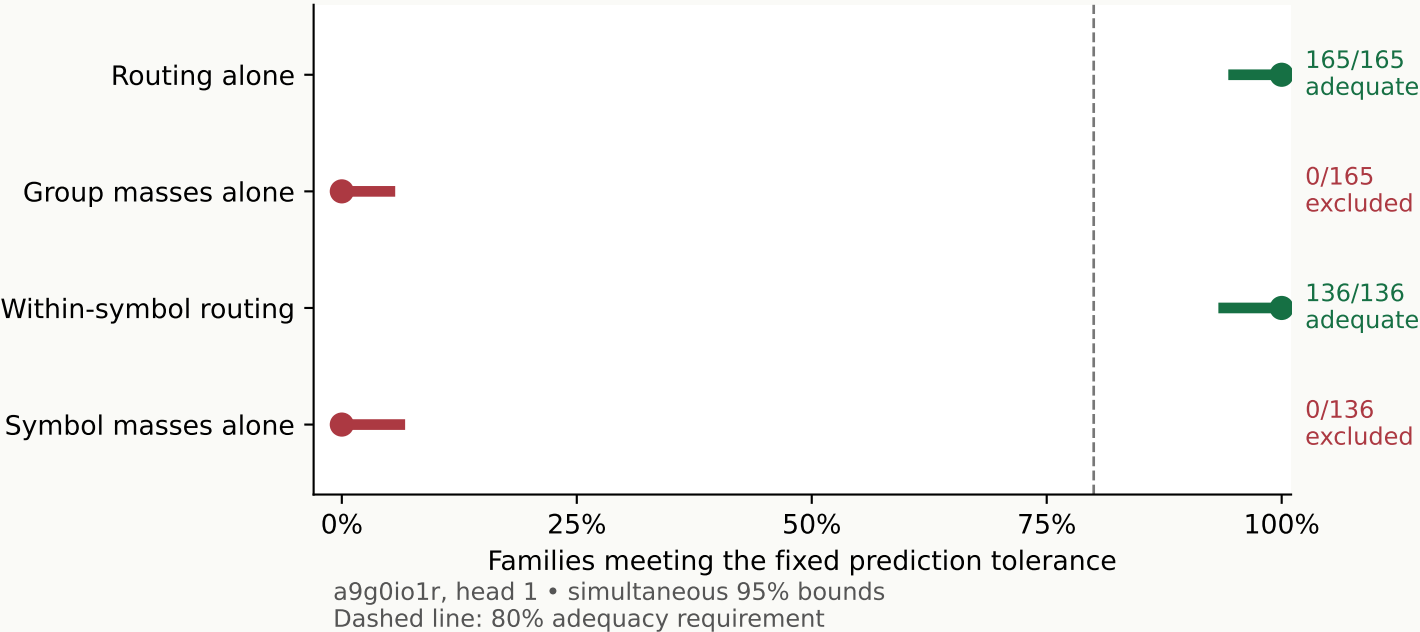

Illustration selected after the cohort run; the full transfer cohort is shown below. Rules and simultaneous bounds were fixed before the run.

1 Separate the changes made by a patch

	BOS/EOS/bracket group masses	Open/close proportions	Routing among identical symbols
Native N	N	N	N
Full uniform U	U	U	U
Bracket routing R	N	U	U
Group masses G	U	N	N
Within-symbol W	N	N	U
Symbol masses T	N	U	N

N = native factor U = uniform factor
Same model, values, readout and target head.

2 Test predictions on fresh families

What was actually narrowed?

Full patch changes the output

↓ Test which component reproduces that change

Bracket routing passes its own adequacy test.
Within-symbol redistribution then passes the
separate test of the bracket-routing effect.

Still open: contextual or positional content of the values.
The stages have separate conditional populations.

3 Keep the transfer failures visible
